Whitepaper:

The problem in the existing market:

Mass adoption, ease of access to cryptocurrency. A minimum of 70% of the population have heard of cryptocurrency, less than 15% of the population own it.

The Nibble project wants to make cryptocurrency easier for people to understand, and easier to get into, whether that's as a miner, or a trader.

The components needed to be able to mine Nibble are all available through the website.

Were not here to revolutionize the crypto scene, were here to support 'the vision' of bringing cryptocurrency to more people.

The solution and the product:

The solution to this is to have an asic resistant algorithm, where people can mine a currency using basic equipment.
A cryptocurrency designed with adoption in mind, allowing people to connect with each other, and become familiar with how cryptocurrencies work.

Competitive landscape & market size:

There are lots of new coins produced everyday, everyone wanting to get onto the latest hype, hoping to make a fortune mining new coins the fastest, and selling them off on a market, having no interest in the actual project itself.

At Nibble, our objective is to support the adoption of cryptocurrency, people will buy and sell on markets, that wont be stopped, however we wont put a price on our own product, the community will decide this through trading.

Key investment considerations:

There was a premine of just 1%, only to swap out the minted coins from the old blockchain. There are no developer finders fees, no hidden transaction fees, no outside funding for the project. This is to show the community how invested in our product we are. The project is completely ran unfunded, donations can be made to support the project, please visit the website home page if you would like to do this where you can find the donation address.

Technical explanation of the token economy and use case(s):

NibbleClassic uses CryptoNight lite v7. Our use case is quite a simple one, were not revolutionizing the scene, were not promising mobile mining, were not promising miracle payment methods or anything fancy...
Were here to spread the word about cryptocurrency, and get more people involved, and keep things simple.

There will be 210000000.00NBX available as a max supply
Emission started at 200NBX as a reward per block
Each block takes 150 seconds to mine
Each block is unlocked and available for spend at 24 block confirmations

    Team behind the project:

Sudosups & the community

NibbleClassic has a block time of 150 seconds which is what I like to dub
as being in the goldilocks zone... at 150 seconds, this gives 24 blocks
at a one hour rate, based on the supply and emmision rate, pushes 200
reward per block as a starting point, not too little a reward, not too
much, just right... The goldilocks zone.

We have an awesome community, we now have 2 official mining pools, a
block explorer, awesome website, Paper wallet.

The best part is, under the hood were Turtle powered!

Our community is rapidly growing, bringing in new ideas and new
developments, all adding to the future success of NibbleClassic

Everyone likes a little nibble! So come join us!
